

AMENDMENTS TO THE CLAIMS

The following listing of the claims replaces all prior versions.

1. (Currently Amended) A method of triggering registration of a mobile station in a wireless network supporting broadcast multicast services, comprising
triggering generation of~~generating~~ a registration message based on a change in flow and frequency, from a first flow to a second flow and from a first frequency to a second frequency, ~~that is~~as monitored by the mobile station, if the second frequency is not known to the network based on a first flow identifier information previously register the mobile station with the network.
2. (Currently Amended) The method of claim 1, wherein the first flow identifier information is a broadcast-multicast service flow ID that the mobile station had previously registered with the network.
3. (Original) The method of claim 1, wherein the first or second frequency monitored by the mobile station is a frequency of broadcast multicast content being received by the mobile station.
4. (Currently Amended) The method of claim 1, wherein triggering generation of the~~generating~~ a registration message includes the mobile station:
 - changing from the first frequency to the second frequency;
 - determining whether presence of the mobile station's monitoring of the second frequency is known to the network, based on a broadcast-multicast service flow identifier that the mobile station previously registered with the network; and
 - transmitting a registration message to the network, if the second frequency does not correspond to a known frequency based on the broadcast-multicast service flow identifier.

5. (Currently Amended) A method of paging a mobile station in a wireless network comprising
paging a mobile station on a given frequency based on a registration message received
from the mobile station indicating the mobile station's presence on that given frequency,
wherein said registration message is generated based on a change in flow and frequency,
from a first flow to a second flow and first frequency to a second frequency, that is monitored by
the mobile station, if the second frequency is not known to the network based on a first flow
identifier information previously registered by the mobile station with the network.

6. (Cancelled).

7. (Currently Amended) The method of claim 6, wherein the first flow identifier information is
a broadcast-multicast service flow identifier that the mobile station has previously registered
with the network.

8. (Original) The method of claim 6, wherein the frequency monitored by the mobile station is a
frequency of broadcast-multicast content being received by the mobile station.

9. (Original) The method of claim 6, wherein generating a registration message includes the
mobile station:

changing from the first frequency to the second frequency;

determining whether presence of the mobile station's monitoring of the second frequency
is known to the network, based on a broadcast-multicast service flow identifier that the mobile
station previously registered with the network; and

transmitting a registration message to the network, if the second frequency does not
correspond to a known frequency based on the broadcast-multicast service flow identifier.

10. (Currently Amended) A method of determining a frequency of broadcast-multicast content being monitored by a mobile station ~~at~~in a wireless network, comprising

generating, at the mobile station, a registration message based on a change in flow and frequency, if the frequency monitored by the mobile station that is not known to the network based on flow identifier information previously registered by the mobile station with the network, and

determining an updated frequency being monitored by the mobile station from the generated registration message.

11. (Original) The method of claim 10, wherein the flow identifier information is a broadcast-multicast service flow identifier that the mobile station had previously registered with the network.

12. (Original) The method of claim 10, wherein the frequency monitored by the mobile station is contained in the registration message.

13. (Original) The method of claim 10, wherein generating a registration message includes the mobile station:

changing from the first frequency to the second frequency;

determining whether presence of the mobile station's monitoring of the second frequency is known to the network, based on a broadcast-multicast service flow identifier that the mobile station previously registered with the network; and

transmitting a registration message to the network, if the second frequency does not correspond to a known frequency based on the broadcast-multicast service flow identifier.
